**To Whom It May Concern,**

**Re Systems Interface Limited**

Following a commercial tender Systems Interface was awarded the contract by Belfast International Airport to replace the Voice Communications Control System (VCCS) within the Air Traffic Control facilities, operated by NATS.

The VCCS was initially considered for replacement and Systems Interface was tasked with integrating the new equipment with the existing communications system replacing the 'last of its kind' TDCE and RDCE voice system. Systems Interface worked closely with NATS to agree a transition plan. During the course of the works, Systems Interface identified the benefit of including new UHF and VHF transmitters and receivers to facilitate the transition, these systems also being at the end of their design life.

Systems Interface worked closely with Belfast International's Engineering team and NATS Engineers and achieved a seamless transition in parallel with the legacy system with zero downtime of the new end to end voice communications system which became fully operational in March 2013.

I would be pleased to recommend Systems Interface Limited to their potential customers.

Yours faithfully,

Denis Brown  
Technical Services Manager  
Belfast International Airport Ltd.
